1 PostgreSQL Warm-Up

Notes:

- Find a partner to work with. (Two persons per team)
- For this task, you need access to the informatikum network. If you are not using a pool-PC, either connect to the university network via informatik-vpn (See: https://www.inf.uni-hamburg.de/en/inst/irz/it-services/private-devices/vpn-clients.html) or connect via ssh (https://www.inf.uni-hamburg.de/en/inst/irz/it-services/private-devices/ssh-service.html).
 - If you want to use the VPN variant,
 connect to the Informatics VPN and not to the RRZ VPN (see Fig. 1)
- Each team has its own interdependent database access. The credentials will be provided by the tutors.
- This (and only this) sheet has no due date and does not have to be presented.
- All other sheets must be presented to a tutor no later than the due date.

| Points | - | | | |
| Release Date | April 15 th 2025 | Due Date | _ | |

1.1 PostgreSQL interactive terminal (psql)

Use an environment of your choice. Either install locally the PostgreSQL-client(Linux or WSL¹) or download the binaries (https://www.postgresql.org/download/).

a) Establish an interactive connection to the database dis-2025:

```
psql -h vsisdb.informatik.uni-hamburg.de -U <username> -W dis-2025
Password: <password - no feedback while typing>
```

- b) Find and open the command-line interface help in psql.
- c) Create a table with at least three columns of different data types.
- d) Disconnect from database dis-2025 using the command \q
- e) Create a script that inserts 3 records of your choice into the newly created table. First, save the script in a text-based file and then run it.

1.2 **GUI**

Connect with a GUI to your database. You can use software of your choice to connect with the database. (DataGrip(free for Students), DBeaver, pgAdmin) For this example, we will work with DBeaver.

- a) Download DBeaver for your system https://dbeaver.io/download/ and start it.
- b) Set up a connection to database dis-2025 by clicking the + button in the upper left. In the pop-up window select postgreSQL and enter the following values:

Serverhost: vsisdb.informatik.uni-hamburg.de
Port: 5432 User Name: <username>
Database: dis-2025 Password: <password>

- c) If you are not connected to the VPN, enter your ssh credentials in the SSH tab.
- d) Confirm the settings and make yourself comfortable with the environment
- e) Select the SQL tab, design a SELECT query against the table you created before and run the query.
- f) Select your schema in the Objects tab which lets you show the content of your table and change any of the records.
- g) Delete the created table, including all records.
- h) Quit DBeaver.

¹Windows Subsystem for Linux
